Relations and Functions

Ordered Pair

An ordered pair consists of two objects or elements in a given fixed order.

Equality of Two Ordered Pairs

Two ordered pairs (a, b) and (c, d) are equal if $a = c$ and $b = d$.

Cartesian Product of Two Sets

For any two non-empty sets A and B , the set of all ordered pairs (a, b) where $a \in A$ and $b \in B$ is called the cartesian product of sets A and B and is denoted by $A \times B$.

Thus, $A \times B = \{(a, b) : a \in A \text{ and } b \in B\}$

If $A = \Phi$ or $B = \Phi$, then we define $A \times B = \Phi$

Note:

- $A \times B \neq B \times A$
- If $n(A) = m$ and $n(B) = n$, then $n(A \times B) = mn$ and $n(B \times A) = mn$
- If atleast one of A and B is infinite, then $(A \times B)$ is infinite and $(B \times A)$ is infinite.

Relations

A relation R from a non-empty set A to a non-empty set B is a subset of the cartesian product set $A \times B$. The subset is derived by describing a relationship between the first element and the second element of the ordered pairs in $A \times B$.

The set of all first elements in a relation R is called the domain of the relation R , and the set of all second elements called images is called the range of R .

Note:

- A relation may be represented either by the Roster form or by the set of builder form, or by an arrow diagram which is a visual representation of relation.
- If $n(A) = m$, $n(B) = n$, then $n(A \times B) = mn$ and the total number of possible relations from set A to set $B = 2^{mn}$

Inverse of Relation

For any two non-empty sets A and B . Let R be a relation from a set A to a set B . Then, the inverse of relation R , denoted by R^{-1} is a relation from B to A and it is defined by

$$R^{-1} = \{(b, a) : (a, b) \in R\}$$

Domain of $R =$ Range of R^{-1} and

Range of $R =$ Domain of R^{-1} .

Functions

A relation f from a set A to set B is said to be function, if every element of set A has one and only image in set B .

In other words, a function f is a relation such that no two pairs in the relation have the first element.

Real-Valued Function

A function $f : A \rightarrow B$ is called a real-valued function if B is a subset of \mathbb{R} (set of all real numbers). If A and B both are subsets of \mathbb{R} , then f is called a real function.

Some Specific Types of Functions

Identity function: The function $f : \mathbb{R} \rightarrow \mathbb{R}$ defined by $f(x) = x$ for each $x \in \mathbb{R}$ is called identity function.

Domain of $f = \mathbb{R}$; Range of $f = \mathbb{R}$

Constant function: The function $f : \mathbb{R} \rightarrow \mathbb{R}$ defined by $f(x) = C, x \in \mathbb{R}$, where C is a constant $\in \mathbb{R}$, is called a constant function.

Domain of $f = \mathbb{R}$; Range of $f = C$

Polynomial function: A real valued function $f : \mathbb{R} \rightarrow \mathbb{R}$ defined by $f(x) = a_0 + a_1x + a_2x^2 + \dots + a_nx^n$, where $n \in \mathbb{N}$ and $a_0, a_1, a_2, \dots, a_n \in \mathbb{R}$ for each $x \in \mathbb{R}$, is called polynomial function.

Rational function: These are the real function of type $f(x)/g(x)$, where $f(x)$ and $g(x)$ are polynomial functions of x defined in a domain, where $g(x) \neq 0$.

The modulus function: The real function $f : \mathbb{R} \rightarrow \mathbb{R}$ defined by $f(x) = |x|$

or

$$f(x) = \begin{cases} -x, & x < 0 \\ x, & x \geq 0 \end{cases}$$

for all values of $x \in \mathbb{R}$ is called the modulus function.

Domain of $f = \mathbb{R}$

Range of $f = \mathbb{R}^+ \cup \{0\}$ i.e. $[0, \infty)$

Signum function: The real function $f : \mathbb{R} \rightarrow \mathbb{R}$ defined

by $f(x) = |x|x, x \neq 0$ and $0, \text{ if } x = 0$

or

$$f(x) = \begin{cases} |x|, & x \neq 0 \\ 0, & x = 0 \end{cases} = \begin{cases} -1, & x < 0 \\ 0, & x = 0 \\ 1, & x > 0 \end{cases}$$

is called the signum function.

Domain of $f = \mathbb{R}$; Range of $f = \{-1, 0, 1\}$

Greatest integer function: The real function $f : \mathbb{R} \rightarrow \mathbb{R}$ defined by $f(x) =$

$\{x\}$, $x \in \mathbb{R}$ assumes that the values of the greatest integer less than or equal to x , is called the greatest integer function.

Domain of $f = \mathbb{R}$; Range of $f = \text{Integer}$

Fractional part function: The real function $f : \mathbb{R} \rightarrow \mathbb{R}$ defined by $f(x) = \{x\}$,

$x \in \mathbb{R}$ is called the fractional part function.

$$f(x) = \{x\} = x - [x] \text{ for all } x \in \mathbb{R}$$

Domain of $f = \mathbb{R}$; Range of $f = [0, 1)$

Algebra of Real Functions

Addition of two real functions: Let $f : X \rightarrow \mathbb{R}$ and $g : X \rightarrow \mathbb{R}$ be any two real functions, where $X \subseteq \mathbb{R}$. Then, we define $(f + g) : X \rightarrow \mathbb{R}$ by

$$(f + g)(x) = f(x) + g(x), \text{ for all } x \in X.$$

Subtraction of a real function from another: Let $f : X \rightarrow \mathbb{R}$ and $g : X \rightarrow \mathbb{R}$ be any two real functions, where $X \subseteq \mathbb{R}$. Then, we define $(f - g) : X \rightarrow \mathbb{R}$ by $(f - g)(x) = f(x) - g(x)$, for all $x \in X$.

Multiplication by a scalar: Let $f : X \rightarrow \mathbb{R}$ be a real function and K be any scalar belonging to \mathbb{R} . Then, the product of Kf is function from X to \mathbb{R} defined by $(Kf)(x) = Kf(x)$ for all $x \in X$.

Multiplication of two real functions: Let $f : X \rightarrow \mathbb{R}$ and $g : X \rightarrow \mathbb{R}$ be any two real functions, where $X \subseteq \mathbb{R}$. Then, product of these two functions i.e. $f \cdot g : X \rightarrow \mathbb{R}$ is defined by $(fg)(x) = f(x) \cdot g(x) \forall x \in X$.

Quotient of two real functions: Let f and g be two real functions defined from $X \rightarrow \mathbb{R}$. The quotient of f by g denoted by $\frac{f}{g}$ is a function defined from $X \rightarrow \mathbb{R}$ as

$$\left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)}, \text{ where } g(x) \neq 0, \forall x \in X.$$
