17. Presence of nitro group at ortho position withdraws electron density from the benzene ring and thus facilitates the attack of nucleophile on haloarene.

18. $\Delta \mathrm{T}_{\mathrm{b}}=\mathrm{K}_{\mathrm{b}} \times \mathrm{m}$

Where molality $=\frac{\text { no. of moles of glucose }}{\text { Weight of solvent }(\text { in } \mathrm{kg})}=\frac{18 / 180 \text { moles }}{1 \mathrm{k} \cdot \mathrm{g}}=0.1 \mathrm{molal}$
$\Delta \mathrm{T}_{\mathrm{b}}=0.52 \mathrm{~K} \mathrm{~kg} \mathrm{~mol}^{-1} \times 0.1 \mathrm{~mol} \mathrm{~kg}^{-1}$
$\mathrm{T}_{\mathrm{f}}-\mathrm{T}_{\mathrm{i}}=0.052$
$\mathrm{T}_{\mathrm{f}}-373.15=0.052$
$\mathrm{T}_{\mathrm{f}}=373.202 \mathrm{~K}$
19. (i) The oxidation state of Ni in $\left[\mathrm{NiCl}_{4}\right]^{2-}$ is +2 and the oxidation state of Ni in $\left[\mathrm{Ni}(\mathrm{CO})_{4}\right]$ is 0 . The presence of strong field ligand CO in $\left[\mathrm{Ni}(\mathrm{CO})_{4}\right]$ pairs all the electrons of Ni to give $\mathrm{d}^{10}$ configuration in which no unpaired electron is available and hence $\left[\mathrm{Ni}(\mathrm{CO})_{4}\right]$ is diamagnetic in nature whereas the presence of weak field ligand $\mathrm{Cl}^{-}$have $\mathrm{d}^{8}$ configuration in which 2 unpaired electron is available and hence $\left[\mathrm{NiCl}_{4}\right]^{2-}$ is paramagnetic.

## QB365-Question Bank Software

(ii) In $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{6}\right]^{3+}$, Co is in +3 state and has $\mathrm{d}^{6}$ configuration. In the presence of $\mathrm{NH}_{3}, 3 \mathrm{~d}$ electrons pair up leaving 2 d-orbitals empty. Hence, the hybridization is $\mathrm{d}^{2} \mathrm{sp}^{3}$ forming an inner orbital complex whereas Ni has +2 oxidation state in $\left[\mathrm{Ni}\left(\mathrm{NH}_{3}\right)_{6}\right]^{2+}$ and $\mathrm{d}^{8}$ configuration which do not pair up. Hence, the hybridization is $\mathrm{sp}^{3} \mathrm{~d}^{2}$ forming an outer orbital complex.

\log [0.4 / 0.289]=\mathrm{k}(20 \mathrm{~min}) / 2.303 \\

21. For the $1^{\text {st }}$ order kinetics,

$$

& \mathrm{k}=1.4 \times 10^{-2} \mathrm{~min}^{-1}
\end{aligned}
$$

Substituting for $75 \%$ completion of reaction-

```
log[\mp@subsup{R}{o}{}/R]=kt/2.303
log}[100/25]=1.4\times1\mp@subsup{0}{}{-2}\mp@subsup{\textrm{min}}{}{-1}(\textrm{t})/2.30
    t=99 min
